The invention further relates to the use of compounds of the formula 1, in which R1, R2, R3 and Arom have the meaning as indicated in the outset, for the preparation of compounds of the formula 2 and their salts

in which R1, R2, R3 and Arom have the meaning as indicated in the outset, which compounds are said to be suitable for treating gastrointestinal disorders.

The following exemplary compounds of the formula 2 (Table 1) can be synthesized from compounds of the formula 1 according to the general procedures outlined in more detail below. Further compounds of the formula 2 which are not listed in table 1 can likewise be prepared from the corresponding compounds of the formula 1.

The invention thus further relates to the compounds of the formula 2 listed in the table 1 above and their salts.

Suitable salts of compounds of the formula 1 and of the formula 2 are – depending on the substitution – in particular all acid addition salts. Particular mention may be made of the pharmacologically accept-

able salts of the inorganic and organic acids customarily used in pharmacy. Those suitable are water-soluble and water-insoluble acid addition salts with acids such as, for example, hydrochloric acid, hydrobromic acid, phosphoric acid, nitric acid, sulfuric acid, acetic acid, citric acid, D-gluconic acid, benzoic acid, 2-(4-hydroxybenzoyl)benzoic acid, butyric acid, sulfosalicylic acid, maleic acid, lauric acid, malic acid, fumaric acid, succinic acid, oxalic acid, tartaric acid, embonic acid, stearic acid, toluenesulfonic acid, methanesulfonic acid or 3-hydroxy-2-naphthoic acid, where the acids are employed in the salt preparation in an equimolar ratio or in a ratio differing therefrom, depending on whether the acid is a mono- or polybasic acid and on which salt is desired.

Pharmacologically unacceptable salts, which can be initially obtained, for example, as process products in the preparation of the compounds of the formula 1 or of the formula 2 according to the invention on an industrial scale, are converted into pharmacologically acceptable salts by processes known to the person skilled in the art.

It is known to the person skilled in the art that the compounds of the formula 1 or of the formula 2 according to the invention and their salts can, for example when they are isolated in crystalline form, comprise varying amounts of solvents. The invention therefore also embraces all solvates and, in particular, all hydrates of the compounds of the formula 1 or of the formula 2, and all solvates and, in particular, all hydrates of the salts of the compounds of the formula 1 or of the formula 2.

The preparation of the compounds of the formula 2 is performed, as shown for example in scheme 1, such that the compounds of the formula 1, in which R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub> and Arom have the meanings as indicated in the outset, are subjected to a cyclization reaction, for example under acidic conditions, using for example sulphuric acid.

**Scheme 1**

Compounds of the formula 2 obtained according to Scheme 1 can be subjected, if desired, to further derivatizations. If compounds of the formula 2 with, for example, R<sub>3</sub> = Br are obtained, further chemical transformations, which are known per se, can be performed to synthesize a great variety of other compounds of the formula 2 by reactions known to the expert. If, for example, compounds where R<sub>3</sub> = -CO-1-4C-alkoxy or R<sub>3</sub> = -CO-NR<sub>31</sub>R<sub>32</sub> are desired, an appropriate derivatization can be performed in a manner known per se (e. g. metal catalysed carbonylation of the corresponding bromo compound or conversion of an ester into an amide).

The compounds of the formula 1 according to the invention, in which R1, R2, R3 and Arom have the meanings as indicated in the outset, can be prepared, for example, following the reaction sequence as outlined in Scheme 2 under standard reaction conditions, as described for example in more detail in the examples.

Scheme 2

Compounds of the formula 3 with R3 = 1-4C-alkoxycarbonyl or -CONR31R32 are known for example from WO 02/20523 or WO 99/55706 or can be prepared with the same or other substituents R3 (for example R3 = halogen) in a manner known to the expert, for example in analogy to the synthesis disclosed in J. Med. Chem. 1985, 28, 876-892.

Compounds of the formula 1 obtained according to Scheme 2 can be subjected, if desired, to further derivatization reactions. If compounds of the formula 1 with, for example, R3 = 1-4C-alkoxycarbonyl are obtained, further chemical transformations, which are known per se, can be performed to synthesize a great variety of other compounds of the formula 1 by reactions known to the expert. If, for example, compounds of the formula 1 where R3 = -CO-NR31R32 are desired, an appropriate derivatization can be performed by methods known to the expert (e.g. conversion of an ester into a carboxylic acid and further into an amide), whereby protection of the amino functionality in 8-position with a suitable protecting group, for example in form of a bis-*tert*-butoxycarbonyl-amino group, may be required during the derivatization reactions.

Alternatively, for example compounds of the formula (1) where R3 = -CO-NR31R32 can be prepared according to schema 3 by derivatization of the substituent R3 on the stage of compounds of the formula 5. If compounds of the formula 1 with, for example, R3 = 1-4C-alkoxycarbonyl are obtained, further chemical transformations, which are known per se, can be performed to synthesize a great variety of other compounds of the formula 1 by reactions known to the expert.

Scheme 3

The compounds of the formula 2 have at least one center of chirality in the skeleton. The invention thus provides all feasible enantiomers of compounds of the formula 2 in any mixing ratio, including the pure enantiomers, which are a preferred subject matter of the invention.

The compounds of the formula 2a, which are a preferred subject matter of the invention,

can be isolated from the corresponding racemic mixtures of the formula 2 by separating the compounds of the formula 2a from their optical antipodes by techniques known to the expert. The separation can be achieved for example by crystallization of diastereomeric salts after reaction of the racemic mixture of acid free compounds of the formula 2 with a suitable, optically pure acid or by preparative chromatography using a chiral column, as described in an exemplary manner in the examples, or by other methods known to the expert.

Among the compounds of the formula 2a, those compounds are preferred wherein R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub> and Arom have the meanings as described above for the compounds of the formula 1.

Although enantiomerically pure tricyclic imidazo[1,2-a]pyridine derivatives are known for example from the International Patent Application WO 95/27714, the higher activity of the compounds of the formula 2a as compared to their optical antipodes was unexpected. So far, the preference for enantiomers of the formula 2a due to a more pronounced activity in inhibiting gastric acid secretion as compared to their optical antipodes has not been described yet for any combination of the substituents R1, R2, R3 and Arom.

It has further been found, unexpectedly, that the enantiomers of the formula 2a have a pronounced activity in inhibiting gastric acid secretion as compared to their optical antipodes.

Preferred exemplary compounds of the formula 2a are those in which R1, R2, R3 and Arom have the meanings as listed in table Table 2.

The invention thus further relates to the compounds of the formula 2a in which R1, R2, R3 and Arom have the meanings as indicated in the outset for the compounds of the formula 1.

The invention further relates to those compounds of the formula 2a listed in table 2 above, and their salts.

The following examples serve to illustrate the invention in greater detail without restricting it. Likewise, further compounds of the formula 1, formula 2 and formula 2a, whose preparation is not described explicitly can be prepared in an analogous manner or in a manner familiar per se to the person skilled in the art using customary process techniques. The abbreviation min stands for minute(s), h for hour(s) and m.p. for melting point.

### Commercial utility

The synthesis of the compounds of the formula 1 and of the formula 2 as described above offers an efficient access to the compounds of the formula 2 and can be used to synthesize a great variety of compounds of the formula 2 with different substituents R1, R2, R3 and Arom. These reaction sequences are also useful and applicable for the synthesis of compounds of the formula 2 on a larger scale.

The compounds of the formula 2 and their salts have valuable pharmacological properties which make them commercially utilizable. In particular, they exhibit marked inhibition of gastric acid secretion and an excellent gastric and intestinal protective action in warm-blooded animals, in particular humans. In this connection, the compounds according to the invention are distinguished by a high selectivity of action, an advantageous duration of action, a particularly good enteral activity, the absence of significant side effects and a large therapeutic range.

"Gastric and intestinal protection" in this connection is understood as meaning the prevention and treatment of gastrointestinal diseases, in particular of gastrointestinal inflammatory diseases and lesions (such as, for example, gastric ulcer, peptic ulcer, including peptic ulcer bleeding, duodenal ulcer, gastritis, hyperacidic or medicament-related functional dyspepsia), which can be caused, for example, by microorganisms (e.g. *Helicobacter pylori*), bacterial toxins, medicaments (e.g. certain antiinflammatories and antirheumatics, such as NSAIDs and COX-inhibitors), chemicals (e.g. ethanol), gastric acid or stress situations. "Gastric and intestinal protection" is understood to include, according to general knowledge, gastroesophageal reflux disease (GERD), the symptoms of which include, but are not limited to, heartburn and/or acid regurgitation.

In their excellent properties, the compounds of the formula 2 according to the invention surprisingly prove to be clearly superior to the compounds known from the prior art in various models in which the antiulcerogenic and the antisecretory properties are determined. On account of these properties, the compounds of the formula 2 and their pharmacologically acceptable salts are outstandingly suitable for use in human and veterinary medicine, where they are used, in particular, for the treatment and/or prophylaxis of disorders of the stomach and/or intestine.

A further subject of the invention are therefore the compounds of the formula 2 according to the invention for use in the treatment and/or prophylaxis of the abovementioned diseases.

The invention likewise includes the use of the compounds of the formula 2 according to the invention for the production of medicaments which are employed for the treatment and/or prophylaxis of the abovementioned diseases.

The invention furthermore includes the use of the compounds of the formula 2 according to the invention for the treatment and/or prophylaxis of the abovementioned diseases.

A further subject of the invention are medicaments which comprise one or more compounds of the formula 2 and/or their pharmacologically acceptable salts.

The medicaments are prepared by processes which are known per se and familiar to the person skilled in the art. As medicaments, the pharmacologically active compounds of the formula 2 according to the invention (= active compounds) are either employed as such, or preferably in combination with suitable pharmaceutical auxiliaries or excipients in the form of tablets, coated tablets, capsules, suppositories, patches (e.g. as TTS), emulsions, suspensions or solutions, the active compound content advantageously being between 0.1 and 95% and it being possible to obtain a pharmaceutical administration form exactly adapted to the active compound and/or to the desired onset and/or duration of action (e.g. a sustained-release form or an enteric form) by means of the appropriate selection of the auxiliaries and excipients.

The auxiliaries and excipients which are suitable for the desired pharmaceutical formulations are known to the person skilled in the art on the basis of his/her expert knowledge. In addition to solvents, gel-forming agents, suppository bases, tablet auxiliaries and other active compound excipients, it is possible to use, for example, antioxidants, dispersants, emulsifiers, antifoams, flavor corrigents, preservatives, solubilizers, colorants or, in particular, permeation promoters and complexing agents (e.g. cyclodextrins).

The active compounds can be administered orally, parenterally or percutaneously.

In general, it has proven advantageous in human medicine to administer the active compound(s) in the case of oral administration in a daily dose of approximately 0.01 to approximately 20, preferably 0.05 to 5, in particular 0.1 to 1.5, mg/kg of body weight, if appropriate in the form of several, preferably 1 to 4, individual doses to achieve the desired result. In the case of a parenteral treatment, similar or (in particular in the case of the intravenous administration of the active compounds), as a rule, lower doses can be used. The establishment of the optimal dose and manner of administration of the active compounds necessary in each case can easily be carried out by any person skilled in the art on the basis of his/her expert knowledge.

If the compounds of the formula 2 according to the invention and/or their salts are to be used for the treatment of the abovementioned diseases, the pharmaceutical preparations can also contain one or more pharmacologically active constituents of other groups of medicaments, for example: tranquilizers (for example from the group of the benzodiazepines, for example diazepam), spasmolytics (for example, biefamiverine or camylofine), anticholinergics (for example, oxyphencyclimine or phencar-

bamide), local anesthetics, (for example, tetracaine or procaine), and, if appropriate, also enzymes, vitamins or amino acids.

To be emphasized in this connection is in particular the combination of the compounds of the formula 2 according to the invention with pharmaceuticals which inhibit acid secretion, such as, for example,  $H_2$  blockers (e.g. cimetidine, ranitidine),  $H^+/K^+$  ATPase inhibitors (e.g. omeprazole, pantoprazole), or further with so-called peripheral anticholinergics (e.g. pirenzepine, telenzepine) and with gastrin antagonists with the aim of increasing the principal action in an additive or super-additive sense and/or of eliminating or of decreasing the side effects, or further the combination with antibacterially active substances (such as, for example, cephalosporins, tetracyclines, penicillins, macrolides, nitroimidazoles or alternatively bismuth salts) for the control of *Helicobacter pylori*. Suitable antibacterial co-components which may be mentioned are, for example, mezlocillin, ampicillin, amoxicillin, cefalothin, cefoxitin, cefotaxime, imipenem, gentamycin, amikacin, erythromycin, ciprofloxacin, metronidazole, clarithromycin, azithromycin and combinations thereof (for example clarithromycin + metronidazole).

In view of their excellent gastric and intestinal protection action, the compounds of formula 2 are suited for a free or fixed combination with those medicaments (e.g. certain antiinflammatories and antirheumatics, such as NSAIDs), which are known to have a certain ulcerogenic potency. In addition, the compounds of formula 2 are suited for a free or fixed combination with motility-modifying drugs.

### Pharmacology

The excellent gastric protective action and the gastric acid secretion-inhibiting action of the compounds of the formula 2 according to the invention can be demonstrated in investigations on animal experimental models. The compounds of the formula 2 according to the invention investigated in the model mentioned below have been provided with letters which correspond to the letters of these compounds in the examples.

#### Testing of the secretion-inhibiting action on the perfused rat stomach

In Table A which follows, the influence of the compounds of the formula 2 according to the invention on the pentagastrin-stimulated acid secretion of the perfused rat stomach after intraduodenal administration in vivo is shown.

#### **Methodology**

The abdomen of anesthetized rats (CD rat, female, 200-250 g; 1.5 g/kg i.m. urethane) was opened after tracheotomy by a median upper abdominal incision and a PVC catheter was fixed transorally in the esophagus and another via the pylorus such that the ends of the tubes just projected into the gastric lumen. The catheter leading from the pylorus led outward into the right abdominal wall through a side opening.

After thorough rinsing (about 50-100 ml), warm (37°C) physiological NaCl solution was continuously passed through the stomach (0.5 ml/min, pH 6.8-6.9; Braun-Unita I). The pH (pH meter 632, glass electrode EA 147;  $\phi$  = 5 mm, Metrohm) and, by titration with a freshly prepared 0.01N NaOH solution to pH 7 (Dosimat 665 Metrohm), the secreted HCl were determined in the effluent in each case collected at an interval of 15 minutes.

The gastric secretion was stimulated by continuous infusion of 1  $\mu$ g/kg (= 1.65 ml/h) of i.v. pentagastrin (left femoral vein) about 30 min after the end of the operation (i.e. after determination of 2 preliminary fractions). The substances to be tested were administered intraduodenally in a 2.5 ml/kg liquid volume 60 min after the start of the continuous pentagastrin infusion.

The body temperature of the animals was kept at a constant 37.8-38°C by infrared irradiation and heat pads (automatic, stepless control by means of a rectal temperature sensor).
